Document Overview

This document describes configuring the Ribbon Session Border Controller (SBC) 5400 when connecting to **Deutsche Telekom "DeutschlandLAN" SIP trunks**.

For additional information about Ribbon SBC, visit <https://ribboncommunications.com/>.

Introduction

The interoperability compliance testing focuses on verifying inbound and outbound call flows between the Ribbon SBC 5400 and **Deutsche Telekom "DeutschlandLAN" SIP trunks**.

Audience

i This configuration guide is offered as a convenience to Ribbon customers. The specifications and information regarding the product in this guide are subject to change without notice. All statements, information, and recommendations in this guide are believed to be accurate, but are presented without warranty of any kind, express, or implied, and are provided "AS IS". Users must take full responsibility for the application of the specifications and information in this guide.

Requirements

The following equipment and software are used in the reference configuration:

	Equipment	Software Version
Ribbon Communications	Ribbon SBC 5400 BMC BIOS SonusDB EMA	V7.1.2 V03.18.00-R001 V01.17.00 V07.02.01-R000 V07.02.01-R001
Third-party Equipment	DSL Line	N/A

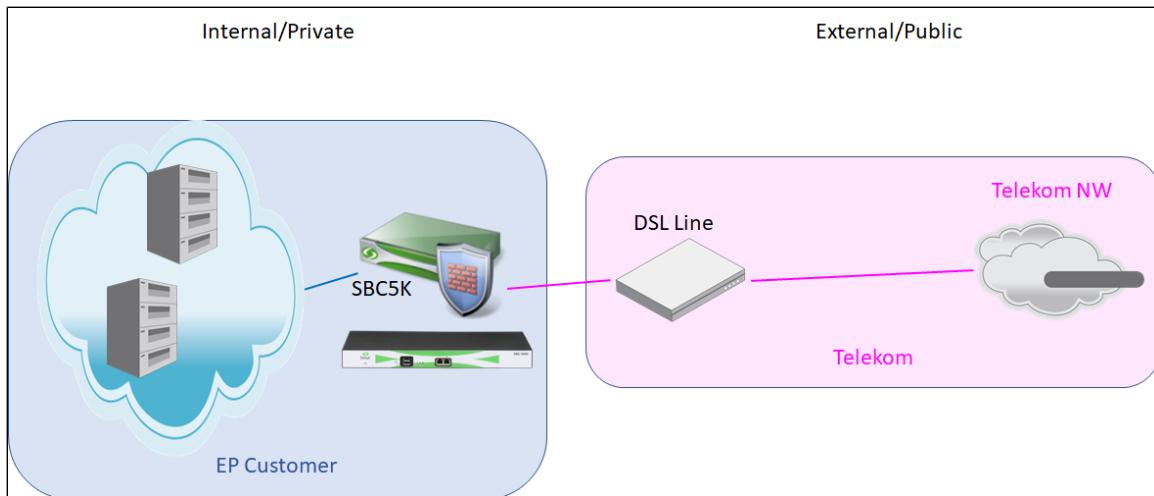

Reference Configuration

The following reference diagrams show connectivity between the Ribbon SBC 5400 and third-party equipment that interoperates with the SBC. In this IOT we have two SIP trunks configuration:

1.SIP Trunk Pooling:

- Internet Access and Telephony Services are both from **Deutsche Telekom**.

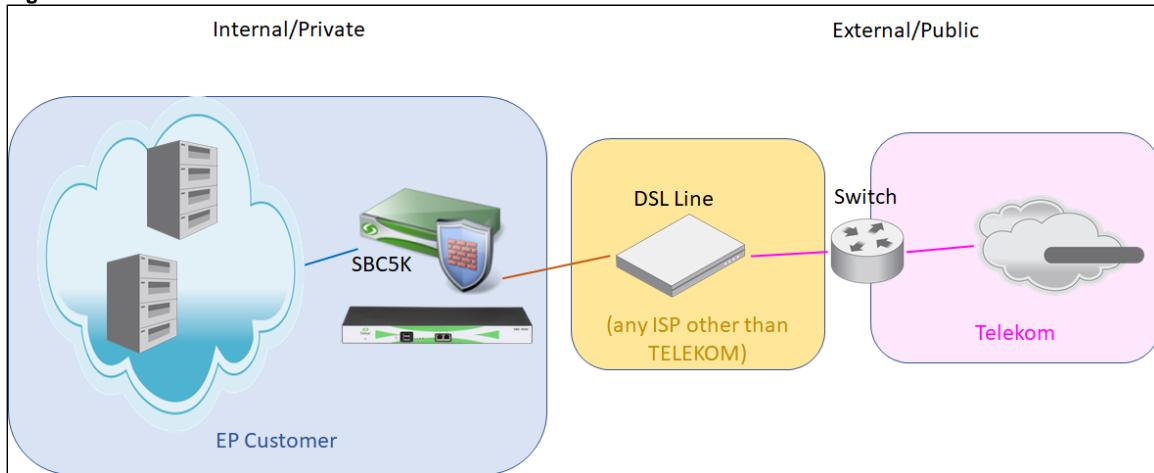

Figure 1: SIP Trunk Pooling

2.SIP Trunk Pure:

- Pure means without internet access from **Deutsche Telekom**.
- Use the telephony from **Deutsche Telekom** through a 3rd party ISP.

Figure 2: SIP Trunk Pure

Note
In both cases the general setup is the same, except the ISP is a different one.

For questions about this document, contact Ribbon Support:

- Global Support Assistance Center +1-978-614-8589 or +1-888-391-3434 (English language Support)
- Web: <https://ribboncommunications.com/services/ribbon-support-portal-login>

Deutsche Telekom Requirements

DT requires the SBC to perform **Surrogate Registrations** on behalf of internal IP PEERS/customers. Without a successful registration for each internal peer, calls are not allowed, and **Deutsche Telekom** sends a SIP 403 Forbidden message to any INVITE message from the SBC.

FQDN used for SIP registrations and calls: reg.sip-trunk.telekom.de

The SRV response of the FQDN query for reg.sip-trunk.telekom.de contains 3 A records (for example, n-ipr-a01.sip-trunk.telekom.de, s-ipr-a01.sip-trunk.telekom.de, h-ipr-a01.sip-trunk.telekom.de).

Those 3 A records have different weight and priority and may rotate after a random period of time.

So far, **Deutsche Telekom** uses tens of registrar servers and rotates them randomly to ensure load distribution for registrations and calls.

For calls from a customer to **Deutsche Telekom**, **Deutsche Telekom** requires:

- the INVITE to come from the same source TCP port number as the source TCP port which the surrogate registration REGISTER message was sent from
- the Contact header of the INVITE towards TELEKOM must contain the same reginfo parameter as the reginfo parameter in the Contact header of the surrogate registration REGISTER

If the calls do not meet the conditions described above, **Deutsche Telekom** responds with the 100 Trying message and after 15 seconds with the SIP 403 Forbidden message.

To correct the conditions, do the following:

- set the requireRegistration on INTERNAL sipTrunkGroup to required-group
- enable the maskPortForRcb flag on the sipSigPort in the INTERNAL zone

Note for incoming calls

If the SBC adds the "dtg" parameter into the Contact header of the SIP REGISTER message, **Deutsche Telekom** places this "dtg" parameter into the R-URI line of the incoming INVITE message from **Deutsche Telekom** to the SBC.

Some customers use the SMM rule to strip this "dtg" parameter from the incoming INVITE message to force routing based on trunkgroup /standard route. Otherwise, SBC uses the "dtg" parameter to find the egress trunkgroup to route the call.

Ribbon SBC 5000 Configuration

The following steps provide an example of how to configure the Ribbon SBC 5000.

Complete Configuration

```
#-----IP Peer-----#

DNS Configuration on SBC

Successful NAPTR/SRV/A DNS lookups are necessary for successful calls from customer to **Deutsche Telekom**.
There are several issues in this area:

SBX-87340

Skip the NAPTR lookup for reg.sip-trunk.telekom.de by specifying the outgoing transport type in the Telekom ipSignalingProfile -> **transportPreference set to tcp**. This enables the SBC to skip the NAPTR lookup, and start with an SRV lookup for _sip._tcp.reg.sip-trunk.telekom.de. The SRV response will contain 3 A records (for example, n-ipp-a01.sip-trunk.telekom.de) and also the A results for these 3 A records.

The Google DNS server 8.8.8.8 configured under the dnsGroup **Deutsche Telekom** is sufficient for resolving all the Telekom's FQDN's and all type of lookups (such as NAPTR, SRV and A lookups).

NAPTR lookup

You can expect the SBC to skip the NAPTR lookup in a call. Originally, the DNS issue showed that the SBC skipped the SRV lookup for calls from Customer to **Telekom** (that is, the SBC performed SRV lookup for outgoing surrogate registration REGISTER messages). To resolve this issue, enable the **noPortNumber5060** in the TELEKOM_IPSP.

DNS Configuration

```
set profiles signaling ipSignalingProfile TELEKOM_IPSP commonIpAttributes flags noPortNumber5060 enabled

set addressContext default dnsGroup TELEKOM type ip
set addressContext default dnsGroup TELEKOM transport udp
set addressContext default dnsGroup TELEKOM interface QSC_212.IPIG
set addressContext default dnsGroup TELEKOM useConfiguredDnsServer enabled
set addressContext default dnsGroup TELEKOM ednsSupport enabled
set addressContext default dnsGroup TELEKOM server 8.8.8.8 state enabled
set addressContext default dnsGroup TELEKOM server 8.8.8.8 recursionDesired true
set addressContext default dnsGroup TELEKOM server 8.8.8.8 ipAddress 8.8.8.8
set addressContext default dnsGroup TELEKOM server 8.8.8.8 transportProtocol udp
set addressContext default dnsGroup TELEKOM server 8.8.8.8 tcpFallback enabled
set addressContext default dnsGroup TELEKOM server 8.8.8.8 priority 5
set addressContext default dnsGroup TELEKOM server 8.8.8.8 weight 0
set addressContext default dnsGroup TELEKOM server 8.8.8.8 recordOrder priority
```

Known limitations on SBC Core

SBX-87340, detailed description in "DNS Configuration on SBC" section.

- After resolving the SBX-87340 issue, do not skip the NAPTR query; instead, disable the flag called **noPortNumber5060** on the TELEKOM IP Signaling Profile.

Conclusion

These Application Notes describe the configuration steps required for Ribbon SBC 5400 to successfully interoperate with **Deutsche Telekom**. The test cases were completed and passed.
